US-09-302-305C-10

Sequence 10, Application US/09302305C

Fatent No. 635672

GENERAL INFORMATION:
APPLICANT: Bernards, Rene
TITLE OF INVENTION: Co-Activators and Uses Thereof in Assays
TITLE OF INVENTION: Co-Activators and Uses Thereof in Assays
TITLE OF INVENTION Co-Activators and Uses Thereof in Assays
CURRENT PILICATION NUMBER: US/09/302,305C
CURRENT PILING DATE: 1999-04-30

FRIOR PAPLICATION NUMBER: PT/GB99/00440

NUMBER OF SEQ ID NOS: 27

NUMBER OF SEQ ID NOS: 27

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 10

LENGTH: 16
                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NAME/KEY: PEPTIDE

Sequence 38, Application US/09780070

Patent No. 6632616
GENERAL INFORMATION:
APPLICANT: Burke, James
APPLICANT: Strittmater, Warren
APPLICANT: Nagal, Yoshitaka
ITILE OF INVENTION: COMPONDS THAT SELECTIVELY BIND TO EXPANDED POLYGLUTAMINE REPEAT I
TITLE OF INVENTION: AND METHODS OF USE THEREOF
TITLE OF INVENTION: AND METHODS OF USE THEREOF
TITLE OF INVENTION NUMBER: US/09/780,070
CURRENT FILING DATE: 2001-02-09
PRIOR PAPLICATION NUMBER: 60/189,781
PRIOR PAPLICATION NUMBER: 60/189,781
NUMBER OF SEQ ID NOS: 40
SOFTWARE PATENTE ALENTIN VERSION 3.0
SEQ ID NO 38
LENGTH: 16

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Published Applications AA:*

Sequence 8, Application US/09900147

Patent No. US20020103121A1

GENERAL INFORMATION:

APPLICANT: La Thangue, Nicholas B

APPLICANT: Bandara, Lasantha R:

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

FILE REFERENCE: 620-67

CURRENT APPLICATION NUMBER: US/09/900,147

CURRENT APPLICATION NUMBER: EARLIER APPLICATION NUMBER: 09/308,935

PRIOR APPLICATION NUMBER: EARLIER APPLICATION NUMBER: 09/308,935

PRIOR FILING DATE: BARLIER FILING DATE: 1999-05-27

PRIOR FILING DATE: EARLIER FILING DATE: 1996-12-20

NUMBER OF SEQ ID NOS: 18

SOFTWARE: PatentIn Ver. 2.1

SEQ ID NO 8

The specification describes pseudopeptide compounds. These compounds are inhibitors of routes activated by proteins having a tyrosine kinase activity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metastases. The present sequence is derived from the antennapsedia protein, and is a fragment of the pseudopeptide compounds of the
                                                                                                                                                                                                                                                                                                    Pseudopeptides, useful for the treatment of proliferative process disorders, cancers, and metasteses, inhibit paths activated by proteins with a tyrosine kinase activity.

These compounds are inhibitors of routes activated by proteins having a tyrosine kinase activity. The compounds also have high affinity for a growth factor receptor binding protein (Grb2). The pseudopeptide compounds are used for the treatment of disorders of proliferative processes, cancers, and metastrases. The present sequence is derived from the antennapaedia protein, and is a fragment of the pseudopeptide compounds of the

The invention relates to autogene nucleic acids encoding secretable RNA polymerases. The invention also relates to methods, nucleic acids, compounds and compositions for expressing a product of interest in a cell that involve a secretable RNA polymerase. The nucleic acid is useful in treating a disease, e.g. cancer, an autoimmune disease, arthritis, a cardiovascular disease, cystic fibrosis, an infectious disease, sickle
                                                                                                             The present invention relates to peptides that include at least one transduction domain (TD) and a nuclear export sequence (NES) to prepare a vector for transporting diagnostic or therapeutic agents across a tight epithelial junction. The present sequence is one such TD, the TD from the third helix of the pant peptide of the Antennapedia protein from Drosophila. The combination of TD and NES increases the efficiency of transport through tight junctions, compared with use of TD alone. The vectors are useful for delivering nucleic acids, polypeptides, peptide nucleic acids, or a nucleotide analog (e.g. an antineoplastic agent) across the blood-brain barrier or the choroid plexus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA polymerase; cancer; autoimmune disease; cardiovascular disease; arthritis; cystic fibrosis; infection; sickle cell anaemia; herpes; AIDS; pneumonia; tuberculosis; inflammatory disease; gene therapy; cytostatic; immunosuppressive; cardiant; virucide; antiinflammatory.
     Use of vector a peptide containing transduction domain and nuclear export sequence for transporting diagnostic or therapeutic agents across tight epithelial junctions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid for treating diseases, e.g. cancer, autoimmune disease, cardiovascular disease or AIDS, comprises a secretable RNA polymerase expression cassette having a eukaryotic promoter and an RNA polymerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila sp. antennapedia third helix peptide #5.

The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour corrects factor—alpha. The complex is useful for manufacturing a medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-tucleic acid complexes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lipid-nucleic acid complex; polycation, targeting factor; gene therapy; cancer; infection; immune deficiency; gene defect; genetic disease;

The present sequence is anti-allergic peptide 3 consisting of a signal sequence of homeodomain of Drosophila transcription factor, linked to the sequence of homeodomain of Drosophila transcription factor, linked to the certainal d alphai3 appears to ce-terminal G alphai3 appears to mediate the peptidergic pathway leading to exceytosis in mast cells. The invention relates to therapeutic complex molecules which are useful as anti-allergic agents. These anti-allergic agents are useful for treating allergic conditions such as nasal allergy, allergic reaction in the eye or skin, acute urticaria, psoriasis, psychogenic or allergic asthma, interastitial cystitis, bowel diseases, migraines and multiple sclerosis. The therapeutic complex is highly specific, direct and provides targetted treatment of allergies and related inflammatory conditions. It comprises molecules having at least a first segment ie, a signal peptide which is competent for the importation of the complex into the mast cells, and a second segment which is having the anti-allergic effect is able to block or significantly reduce the G protein-mediated contribution to mast cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /label= G alphai3 peptide

The present sequence is anti-allergic peptide 6 consisting of a signal sequence of homeodomain of Drosophila transcription factor, linked to the C-terminal G alphat sequence. The invention relates to therapeutic complex molecules which are useful as anti-allergic agents. These anti-allergic agents are useful for treating allergic conditions such as nasal allergy, allergic reaction in the eye or skin, acute unticaria, psoriasis, psychogenic or allergic asthma, interstitial cystitis, bowel diseases, migraines and multiple sclerosis. The therapeutic complex is highly specific, direct and provides targetted treatment of allergies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17. .26

transduction domain. (TD) and a nuclear export sequence (NES) to prepare a vector for transporting diagnostic or therapeutic agents across a tight epithelial junction. The present sequence is one such peptide. The combination of TD and NES increases the efficiency of transport through tight junctions, compared with use of TD alone. The vectors are useful for delivering nucleic acids, polypeptides, peptide nucleic acids, or a nucleotide analog (e.g. an antineoplastic agent) across the blood-brain barrier or the choroid plexus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

related inflammatory conditions. It comprises molecules having at least first segment ie., a signal peptide which is competent for the importation of the complex into the mast cells, and a second segment which is having the anti-allargic effect is able to block or significantly reduce the G protein-mediated contribution to mast cell degranulation and in turn the release of histamine. The invention also discloses methods for preventing and treating allergies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Penetratin is a membrane translocation polypeptide and as such, active peptide fragments of penetratin can be used to translocate conjugated molecules across the cell membrane e.g. drugs. 13 chemical entities are described for use in the method such as paclitaxel-
2'succinimidopropionoyl-CbetaA-RRWKWK-NH 2, and podophyllotoxin-4-succinimidopropionoyl CbetaA-RRWKWK-NH 2. The method has applications as a drug delivery system for treatment and therapy. The resulting conjugated molecules exhibit high immunogenicity, solubility and clearance. The penetratin peptide fragment may be truncated and or have amino acid substitutions. See GENESEQ records AAY83520-Y83581
                                                                                                                                                                                                                                                         Penetratin; translocation; membrane; drug delivery; therapy; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New membrane translocation peptide carrier group for delivering therapeutic agents into target cells comprises specified sequence of amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

New peptides are provided which are 16 amino acids long and which are analogues of the peptide corresponding to residues 43-58 of the Antennapedia transcription factor homeodomain (AntpHD). The peptides contain 6-10 hydrophobic amino acids. They have the general formula: X1-X2-X3-X4-X5-X16 or X16-X15-X14-X13-X12-X11-X10-X9-X8-X7-TTP-X5-X4-X3-X2-X1 in which X1-X5 and X7-X16 are any alpha-amino acids, provided that: (1) the peptide contains 6-10 hydrophobic amino acids; (2) X3 and X5 are not both Val; and (3) the charged amino acids; (2) X3 and X5 are not both Val; and (3) the peptide contains 6-10 actual hatp 43-58 sequence (the Pro-50 analogue of the 43-58 sequence) is a specific example of the new peptides. The peptides are used as vectors for introducing into live cells compounds which affect cell function, especially peptides and nucleic acids. They can cross cellular membranes and received they are as effective as helix 3 of
                                                                                                        /note= "in determining the ability of this sequence to be internalised in cells, a biotin-aminopentanoyl group was attached to the N-terminal"
                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptide(s) of high hydrophobic amino acid content - useful as vectors delivering peptides and nucleic acids to cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             translocation; membrane; drug delivery; therapy; treatment;

Thus invention describes a novel fluorescence labeling of specific traregers within cells which comprises a membrane translocation component, a targeting component and a membrane translocation component, a targeting component and a component and a fluorephores form a donor-acceptor pair for fluorescence resonance energy transfer (FRET), can be used to measure interactions between two cubstances, especially in living cells, when the targeting component of the ordingates targets one of the substances and the targeting component of the other conjugate targets one of the substance. The conponent of the other conjugate to detect a target in a biologically functional cell. When the conjugate has a fluorophore capable of acting as a donor or acceptor for FRET with a fluorescent protein, it can be used to measure intracellular levels of a fusion protein of the fusion protein of the fusion protein of the cells are expression vector, the vector is used to nonther coding sequence in an expression vector, the vector is used to transform a cell culture, the cell culture is incubated with the fluorescent protein is linked to another coding sequence in an expression vector, the vector is used to transform a cell culture, the cell culture is incubated with the fluorescent protein is green fluorescent protein (GFP) and the fluorophore is BODIPY, fluorescein, oregon green, correcting green, rhodamine, Texas red, Cy2, Cy3, Cy5, Alaxa, Marina blue, pacific blue or AMCA. The cells are especially bacterial, years, insect, antennappedia homeodomain protein which is used to illustrate the method antennappedia homeodomain protein which is used to illustrate the method
   Fluorogenic conjugate for intracellular fluorescence labeling, especially for performing fluorescence resonance energy transfer assays in living cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Membrane transiting peptide; virucide; antiviral; Herpes Simplex Virus;

The method has applications as a drug delivery system for treatment and therapy. The resulting conjugated molecules exhibit high immunogenicity, solubility and clearance. The penetratin peptide fragment may be truncated and or have amino acid substitutions. See GENBSEQ records AAY83520-Y83581

The peptides are useful for treating or preventing a virue infection in a warm blooded animal, e.g., enveloped virues such as human immunodeficiency virus (HIV), herpes simplex virus (HSV), cytomegalovirus (CMV) and non-enveloped virus. Preferably, the peptides are useful for treating or preventing infections from one or more HSVs. The antiviral peptides are used for treating viral infections of the skin or part of the oral or genital cavity. The present sequence is membrane transiting antiviral peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a collection of polypeptides comprising two polypeptides (referred to as an adaptein library) each of which has a fragment of amino acids 119-275 of Venezuelan equine encephalitis virus capsid polypeptide carboxy terminal portion (ABU09576, also known as CCD), beginning at any of amino acids 119-124 and ending at any of amino acids 258-275, where at least two consecutive amino acids within amino acids 129-137, 182-189, 257-264 of CCD are replaced by a variant amino acid sequence. Also included are a population of cells comprising two or more cells (where each member of the population comprises one polypeptide of an adaptein), a fusion protein chosen from an adaptein fused to a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel collection of polypeptides which comprise fragment of Venezuelan equine encephalitis virus capsid polypeptide carboxy terminal portions, useful for displaying variable amino acid sequences on the surface of the
                  antigan-specific receptor on an effector T-lymphocyte precursor cell and a biologically active agent, where there is a cleavage site between the peptide epitope and the biologically active agent and between each biologically active agent is used to make a cell immunogenic or antigenic. It is also useful for preventing and treating an infectious disease such as viral, bacterial, protozoal, fungal or yeast disease, or proliferative disease such as cancer (e.g. melanoma, neural tissue, gastrointestinal, breast, lung, ovarian, testicular, prostate, cervical, bladder, vaginal, liver, renal, bone, haematological or vascular tissue cancer). The invention is used as vaccines. The present sequence is Antennapedia homeodomain (AntpHD) protein
domain, two cleavage sites, a peptide epitope recognised by an

```

It is

```
permeant peptide, a cell comprising the fusion protein, a collection of polynucleotides (comprising at least two polynucleotides, each polynucleotide comprising at coding sequence encoding a polypeptide comprising an adaptein), a vector comprising a member of the comprising an adaptein, a vector comprising a member of the polynucleotide collection of cells comprising two or more cells containing members of the collection of fusion proteins and crystallising a polypeptide comprising CD. The adapteins are useful for identifying a polypeptide within a collection that prevents cell death after exposure to a pathogen (e.g. a virus or microbe such as bacterium, Rickettsia or fungus), or a toxin such as a biological toxin or chemical toxin and is useful for identifying a polypeptide or a polynucleotide. The adaptein is useful in discovery of drugs that can be used to prevent mortality and morbidity associated with pathogens and toxins, including high lethal agents that could be used in biological warfare. The present with the CCD-based adapteins

Maclachlan I; Finn J,

WPI; 2003-156691/15.

New nucleic acid for treating diseases, e.g. cancer, autoimmune disease, cardiovascular disease or AIDS, comprises a secretable RNA polymerase expression cassette having a eukaryotic promoter and an RNA polymerase

Claim 5; Page 4; 65pp; English.

polymerases. The invention also relates to methods, nucleic acids, compounds and compositions for expressing a product of interest in a cell trat involve a secretable RNA polymerase. The nucleic acid is useful in treating a disease, e.g. cancer, an autoimmune disease, arthritis, a cardiovascular disease, cystic fibrosis, an infectious disease, sickle invention relates to autogene nucleic acids encoding secretable RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a composition comprising, conditioned cell culture media, or its extract, comprising at least one culture-derived growth factor assular endothelial growth factor (VGGP), transforming growth factor beta (TGFPeta), hepatocyte growth factor (HGF), keratinocyte growth factor (KGF) interleukin-3 (IL-3), IL-6 or IL-8, at least one culture-derived antioxidant such as glutathione, glutathione peroxidase, glutathione reductase, glutathione disulfide, catalase, superoxide dismutase, apha-tocopherol, gamma-tocopherol, ubiquinol-9, ubiquinone 9, ascorbic acid, cysteine and cystine, and at least one culture-derived soluble collagen, and an appropriate carrier. The composition is useful in cosmetic applications, cosmeceutical applications etc. Sequence ABB82912-930
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition comprising conditioned cell culture media which comprises a culture-derived growth factor (e.g. vascular endothelial growth factor), an antioxidant (e.g. glutathione), and soluble collagen.
cell anaemia, a viral disease, AIDS, a bacterial disease, herpes, pneumonia, tuberculosis or an inflammatory disease, in a patient. It i also used in gene therapy. The present sequence is Drosophila sp. antennapedia third helix peptide used to illustrate the method of the

This invention relates to a novel method of immunoregulation, specifically T cell response regulation by enhancing the immune response apecifically T cell response regulation by enhancing the immune response twith 4-1BB binding agents. 4-1BB (also known as CD137) is a member of the tumour necrosis factor (TMF) receptor family, and is expressed on the surface of activated T-cells. Administration of a 4-1BB binding agent and a tumour specific immunogenic stimulus has been found to result in the regression of that tumour. The binding agent can be an antibody that binds 4-1BB or a natural ligand of 4-1BB (or a functional fragment carries), whereas the immunogenic stimulus is either a tumour associated peptide fragment or a molecule produced by an infectious microorganism e.g. a retrovirus or protozoan parasite. As such, the present invention e.g. a retrovirus or protozoan parasite. As such, the present invention e.g. aretrovirus colon cancer, testicular cancer, bone and cascular tumours. In addition, with an appropriate immunostimulant it can prophylaxis for various infectious diseases.

Furthermore, it has been shown that this method prevents anergy (a depression in immunological function), and can also reverse established anergy, in CD8+ T-cells. This peptide sequence is the antennapedia humanostimulant or 4-1BB binding agents, to specific cellular compartments, the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Generating an enhanced immune response in a subject comprises administering to the subject an immunogenic stimulus (e.g. a tumorassociated antigen) and an agonistic 4-1BB-binding agent (e.g. antibody

```
The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. The side chain linked to the lysine residue at position 1 corresponds to the specific tetrapeptide, while residues 1 to 17 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin expression, e.g. wound contraction, hypertrophic scars, fibromatosis and fibrotic conditions. The present sequence may also be used to treat brupuytren disease and lung fibrosis. The tetrapeptide of the present invention is described in AAB14263
                                                                                                                                                                                                                       /note= "Tetrapeptide of Acetyl-EEED linked on the epsilon -amino group of lysyl residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   chemical entity that is able to introduce the tetrapeptide into the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. The side chain linked to the lysine residue at position I corresponds to the specific tetrapeptide, while residues to 17 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin preventic and/or treatment of a disease related to alpha-SM actin fibrotic conditions. The present sequence may also be used to treat bupuytren disease and lung fibrosis. Note: the present sequence is not shown in the specification but is derived from information given by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the cell.
                                                                                                                                                                                                                            /note= "Pentapeptide of Acetyl-BEBDC is linked via a disulphide bond to the thiol group of the side chain of the cysteine residue"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the tetrapeptide into the target cell. The present sequence is one such peptide. The side chain linked to the lysine residue at position 3 corresponds to the specific tetrapeptide, while residues 3 to 19 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha SM) actin organisation in stress fibers. The present sequence may be used in the
                                                                                                                                                                           /note= "Tetrapeptide of Acetyl-EEED linked on the epsilon -amino group of lysyl residue"
                                                                                                                                                                                                                                                                                                                                                                                                                                                             A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expression, e.g. wound contraction, hypertrophic scars, fibromatosis and fibrotic conditions. The present sequence may also be used to treat Dupuytren disease and lung fibrosis. The tetrapeptide of the present invention is described in AAB14263
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alpha smooth muscle actin; alpha-SM; wound contraction; hypertrophic scar; fibromatosis; Dupuytren disease; fibrotic condition; lung fibrosis.

A peptidic product for prevention and treatment of a disease related to alpha-SM actin expression comprises a tetrapeptide associated with a chemical entity that is able to introduce the tetrapeptide into the cell.

Disclosure; Page; 31pp; English.

The present invention relates to novel peptides comprising of a specific tetrapeptide associated with an oligopeptide which allows the introduction of the terrapeptide into the target cell. The present sequence is one such peptide. Residues 1 to 4 of the present sequence correspond to the specific tetrapeptide, while residues 5 to 20 correspond to the oligopeptide. The specific tetrapeptide of the present sequence interferes with alpha smooth muscle (alpha-SM) actin organisation in stress fibers. The present sequence may be used in the prevention and/or treatment of a disease related to alpha-SM actin prevention and/or treatment of a disease related to alpha-SM actin fibrotic conditions. The present sequence may also be used to treat Dupuytren disease and lung fibrosis. Note: the present sequence is not shown in the specification but is derived from information given by the

Domeotic protein Hox A4 - rat (fragment)
NyAlternate names: homeotic protein Hox 1.4
Cispecies: Rattus norvegicus (Norway rat)
Cispecies: Rattus norvegicus (Norway rat)
Cispecies: 2.Aug-1996
Esquence_revision 23-May-1997 #text_change 20-Aug-1999
Ciscession: 165198

Nonceite protein Hox 2.4
NyAlternate names: homeoric protein Hox 2.4
C;Species homeoric protein Hox 2.4
C;Species was musculus (house mouse)
